Catalytic converter temperature check

The temperature of the catalytic converters is estimated through calibration with the Misfiring system; there are NO more sensors that measure their temperature.

Proper temperature operation with respect to all the other engine parameters is read with the engine running normally; depending on one or more misfirings, how much the temperature varies is CALCULATED.

In this way, the temperature of the catalytic converter is determined depending on the problem.

 It must in any case be remembered that this temperature is not the real one, but only the estimated one.
This value can be seen by means of LaRa-AS (109000).
